

Snippets

Snippets are used to quickly enter standard data into data fields. Unlike Text and Labels, Snippets will replace the entire fielded entry. You can create Snippets for many things like data entry or faster coded entry for medications or vaccines.

To Create Snippets, go to Administration – Prompt / Selection List Mgt

Code	Value
> flu	02362384
M	MYOACTIVATION
n	No Known Drug Allergies
pneumo	02231259
rx	Prescription Refill
sd	Shoppers Drugmart
T3	02163926

1. New Record
2. Enter a 'Code' - try to keep this short for faster entry
3. Enter the Value - What you would like to populate in the field
 - If you are wanting to use a code for a vaccine, medication, etc, enter the code for the associated result into the 'Code' field (Refer to the T3, flu, pneumo example in the screen shot)

To use these Snippets, when in the field to enter date, enter the Tilde (`), and the Code entered into the Snippet List that you created.

For the example below, we are using a Snippet to prefill the Visit Reason on the Daysheet with 'Prescription Refill'.

1. From the Daysheet, go to a booked appointment, place the cursor in the Visit Reason field
2. Enter the Tilde - `
3. Enter - rx

HR	MN	Code	Mode	#	Chart	First Name	Last Name	Visit Reason	Health Issue	Service		
> 09	00	R	DE	6	10036	...	DUDLEY	DO-GOOD	`rx

4. F2/Save

When you save the Snippet will populate with the Value entered in the Snippet List

HR	MN	Code	Mode	#	Chart	First Name	Last Name	Visit Reason	Health Issue	Service		
> 09	00	R	DE	6	10036	...	DUDLEY	DO-GOOD	Prescription Refill
